

Massano Stone/Debris burying Tiller Bedshaper

The Massano is a reverse rotating tiller that works soil and throws dirt up over the tillers rotor to the rear. The soil carrying stones or vegetable debris strikes a vertical “comb” of spring steel tines where loose clean soil passes through while stones, root clumps, clods, etc. are screened out falling to the bottom of cut to be buried by clean soil.

Pictured here is an 80 inch wide Massano tiller that creates a 64 inch bed top that is firmed and finally defined by a hydraulically driven rear roller. Note individual coil springs of the tines that make up the comb behind the rotor.

In this picture you see a 59 inch Massano creating a 43 inch bed top without use of a rear roller.

In this picture you see vegetable debris that Massano will incorporate in a single pass.

In this picture you see the resulting bed left by the Massano without the rear roller option. Note: demonstration was done in Onion field being raised for seed in Northern California.

The 59 inch Massano pictured sells for \$17,500 and the 80 inch model shown in the first and second pictures sells for \$28,000.
