Interrow Cultivator

This split Rototiller gives ideal aggressive power cultivation with great flexibility. Tiller heads of various widths are easily interchanged and added as your crop changes and you adopt different spacings. This machine is ideal for

startups because it could serve as for primary tillage tool, (i.e. two wider tillage units fitted close together) as well as serve as cultivator when moved apart.

After you adopt a spader a season or two down the line, to provide the ideal primary tillage, you will then have a perfect combination of primary and secondary tillage tools.

A 66 inch tool bar, gearbox, and gauge wheel assembly is \$2,500, 20 inch tiller heads \$1,000 each, narrower heads are \$800 each. For little more than cost of a good rototiller you can start your operation with a highly versatile tool that can evolve as your farm does.
