

Newest Electric Harvester

New appropriately scaled Greens-herb Harvester powered by 12 Volt batteries for fume free cutting is ready for production. The low voltage systems allows recharging from solar panels as well as from house current using standard auto battery charger. An electric system eliminates all chance of dripping gas or oil in growing area.

The heart of this harvester is its cutting head. It is patterned after the "Ortomec Herbex" Cutter head used on large commercial units. It uses a razor sharp stainless steel blade moving back and forth at the correct speed. The cut is clean no matter how fine and flexible the plant stem. Clean, tear free cuts results in better looking product and a longer shelf life.

A separate electric motor with correct gear reductions permits food grade conveyor belt to catch crop at instant it is cut and to carry it up and into totes without being touched by anyone's hands, avoiding crushing and any possible contamination. A cutting width of 28" has been selected and the weight of machine and batteries have been minimized to allow machine to be hand pushed.

Introductory price is \$7,000 Fob Northern California with machine ready in 30 days of order. These will

be built in batches of (5) at a time so get your order in soon for earliest delivery.

Side view shows adjusting screw to set front height adjustment, battery tray for one or more, large rear roller and tote platform.
