One Pass Seedbed Tiller

A debris burying tiller turns trashy field to fine ready to plant seedbed in one pass. This reverse rotation tiller works soil, sorts out debris and covers it with several inches of crumbled soil. Stones, hard clods, root balls, stalks and grass are buried with only fine dirt passing through steel "comb" to form seedbed compressed and leveled by a mesh roller behind the tiller.

Because all this occurs in a single pass, damage to soil structure is minimized. Elimination of second passes and time saved raking out debris saves labor and lets you speed up planting. No debris in seed bed also means

easier precision planting.

A 24" unit for 10-12 HP walking tractor is \$2,900. Many larger models designed for (4) wheel tractors start at \$4,500. Order today for spring delivery.
