

Rotair Tool Carrier

HAMMER FLAIL

TURBO SPRAYER

Small tracked transporters are made by many Italian and German producers and offer flat beds or dump beds capable of carrying 500 lbs. to 1000 lbs. The Rotair is all that and then some. This 20HP hydrostatically powered crawler is a tool carrier capable of replacing a tractor. The hydraulic auxiliary outlets the Rotair provide power for every kind of implement needed for grapes, berries, orchard crops and green house operations.

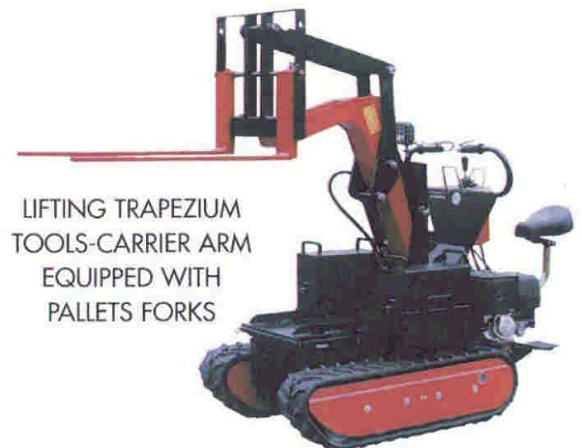

GRAPE AND ORANGE
LUG CARRIER

Just 32 inches wide, 59" long and 1760 lbs. fully loaded it can handle slopes to 30 degrees or more. With 448 square inches of track on the ground, ground pressure is under 4 lbs. per square inch; Its 3pt. suspension and auxiliary hydraulic circuits allows it to mow, till, excavate, spray and prune as well as transport loads of all kinds. The small size allows you to maximize growing areas for intensive farming, very little turning room on headlands saves space. Operator stands or sits at rear and can step on and off without fatigue as foot board is just 8" off ground. The overhead clearance needs to be less than 12 inches more than drivers height, allowing green houses, shade structures and trellis systems to be kept low.

Those planning high density cropping systems and those who farm slopes or terraces should look closely at the Rotair system before trying to solve mechanization problems with conventional tractor implements. The basic tracked power unit costs \$15,000.
